Maximum cost of a path (2)
Examen parcial d'Algorísmia, FME (2011-10-27)
Given a directed and complete graph with $n$ vertices, compute the maximum cost of all the paths with the vertices in increasing order. The given graph is represented by an $n \times n$ matrix $M$, where for every pair $(i, j)$ with $i \neq j, m_{i j}$ is the (perhaps negative) cost of the arc from $i$ to $j$.
For instance, the maximum cost of the first test is 100 , because of the path $0 \rightarrow 1 \rightarrow 3 \rightarrow 4$, with cost $20-10+90=100$.

## Input

Input consists of the number of vertices $n$, followed by the matrix $M$ ( $n$ lines, each one with $n$ integer numbers), followed by the initial vertex $x$. Vertices are numbered from 0 to $n-1$. You can assume $1 \leq n \leq 10^{3}$, that the diagonal has only zeros, and that the rest of numbers are between $-10^{6}$ and $10^{6}$.

## Output

Print the maximum cost of all the paths with the vertices in increasing order.

| Sample input 1 |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 6 |  |  |  |  |  |
| 0 | 20 | 5 | -3 | 80 | -2 |
| 11 | 0 | 30 | -10 | -12 | 3 |
| 22 | -10 | 0 | -50 | 15 | -5 |
| 23 | -60 | 35 | 0 | 90 | 7 |
| 97 | 14 | -70 | -11 |  |  |
|  | 2 | 3 | 4 | 5 |  |

## Sample input 2

1
0

## Sample input 3

3
$0-6 \quad 8$
$\begin{array}{lll}-4 & 0 & 9\end{array}$
$\begin{array}{lll}-7 & -2 & 0\end{array}$
